# Section 1

## $z$ -Transform

# Introduction

- We developed the Laplace transform as a generalization of the continuous-time Fourier transform.
- In this lecture, we introduce the corresponding generalization of the discrete-time Fourier transform.
- The resulting transform is referred to as the  $z$ -transform.

# $z$ -Transform Motivation

- The discrete-time Fourier transform developed out of choosing complex exponentials as basic building blocks for signals because they are eigenfunctions of discrete-time LTI systems.
- A more general class of eigenfunctions consists of signals of the form  $z^n$ , where  $z$  is a general complex number. A representation of discrete-time signals with these more general exponentials leads to the  $z$ -transform.

# Relationship between the $z$ -Transform and the Discrete-Time Fourier Transform

- We saw that the Laplace transform is a generalization of the continuous-time Fourier transform.
- A close relationship exists between the  $z$ -transform and the discrete-time Fourier transform.
- For  $z = e^{j\omega}$  or, equivalently, for the magnitude of  $z$  equal to unity, the  $z$ -transform reduces to the Fourier transform.
- More generally, the  $z$ -transform can be viewed as the Fourier transform of an exponentially weighted sequence.
- Because of this, the  $z$ -transform may converge for a given sequence even if the Fourier transform does not: the  $z$ -transform offers the possibility of transform analysis for a broader class of signals and systems.

# The Region of Convergence (ROC)

- The  $z$ -transform of a signal too has associated with it both a range of values of  $z$ , referred to as the region of convergence (ROC), for which this expression is valid.
- Two different sequences can have  $z$ -transforms with identical algebraic expressions such that their  $z$ -transforms differ only in the ROC.
- Consequently, the ROC is an important part of the specification of the  $z$ -transform.

# $z$ -Plane

- $z$ -transforms of the form of a ratio of polynomials in  $z^{-1}$  are described by poles and zeros in the complex plane, referred to as the  $z$ -plane.
- The circle of radius 1, concentric with the origin in the  $z$ -plane, is referred to as the **unit circle**.
- Since this circle corresponds to the magnitude of  $z$  equal to unity, it is the contour in the  $z$ -plane on which the  $z$ -transform reduces to the Fourier transform.
- In contrast, for continuous time it is the imaginary axis in the  $s$ -plane on which the Laplace transform reduces to the Fourier transform.
- If the sequence is known to be right-sided, for example, then the ROC must be the portion of the  $z$ -plane outside the circle bounded by the outermost pole.

# Outline

## $z$ -Transform

The  $z$ -Transform

$z$ -Transform properties

## Recall: Discrete-Time Fourier Transform

$$x[n] = \frac{1}{2\pi} \int_{2\pi} X(e^{j\omega}) e^{j\omega n} d\omega$$
$$X(e^{j\omega}) = \sum_{-\infty}^{+\infty} x[n] e^{-j\omega n}$$

LTI systems: impulse response  $h(t)$ :

$$e^{j\omega n} \rightarrow \begin{array}{c} H(e^{j\omega}) e^{j\omega n} \\ \updownarrow \mathcal{F} \\ h[n] \end{array}$$

## $z$ -Transform: Eigenfunction Property

$$z^n \rightarrow \sum_{k=-\infty}^{+\infty} h[k] z^{n-k}$$

$$z^n \rightarrow z^n \sum_{k=-\infty}^{+\infty} h[k] z^{-k}$$

$$z = r e^{j\omega}$$

$$z^n \rightarrow H(z) z^n$$

$$H(z) = \sum_{n=-\infty}^{+\infty} h[n] z^{-n}$$

# $z$ -Transform

$$X(z) = \sum_{n=-\infty}^{+\infty} x[n]z^{-n}$$

$$x[n] \xleftrightarrow{\mathcal{Z}} X(z)$$

## $z$ -Transform and Fourier Transform Relationship

$$X(\omega) = \sum_{n=-\infty}^{+\infty} x[n]e^{-j\omega n}$$

$$X(z) = \sum_{n=-\infty}^{+\infty} x[n]z^{-n}$$

$$z = re^{j\omega}$$

$$X(z)|_{z=e^{j\omega}} = \mathcal{F}\{x[n]\}$$

New notation:

$$\mathcal{F}\{x[n]\} = X(e^{j\omega})$$

## $z$ -Transform: Convergence Comparison

$$X(z)|_{z=e^{j\omega}} = X(e^{j\omega})$$

$$X(z) = \sum_{n=-\infty}^{+\infty} x[n]z^{-n}$$

$$\begin{aligned} X(re^{j\omega}) &= \sum_{n=-\infty}^{+\infty} x[n] (re^{j\omega})^{-n} \\ &= \sum_{n=-\infty}^{+\infty} x[n] r^{-n} r e^{-j\omega n} \end{aligned}$$

$$X(z) = \mathcal{F} \{x[n]r^{-n}\}$$

## $z$ -Transform: Convergence Comparison

$$X(z)|_{z=e^{j\omega}} = X(e^{j\omega})$$

$$X(z) = \sum_{n=-\infty}^{+\infty} x[n]z^{-n}$$

$$\begin{aligned} X(re^{j\omega}) &= \sum_{n=-\infty}^{+\infty} x[n] (re^{j\omega})^{-n} \\ &= \sum_{n=-\infty}^{+\infty} x[n] r^{-n} r e^{-j\omega n} \end{aligned}$$

$$X(z) = \mathcal{F} \{x[n]r^{-n}\}$$

ZT may converge when FT does not.

## Example

Find the ZT of  $x[n] = a^n u[n]$ .

## Solution

$$\begin{aligned} X(z) &= \sum_{n=-\infty}^{+\infty} x[n]z^{-n} \\ &= \sum_{n=0}^{+\infty} a^n z^{-n} u[n] \\ X(z) &= \frac{1}{1 - az^{-1}}, \quad |az^{-1}| < 1 \end{aligned}$$

## Example

Find the ZT of  $x[n] = a^n u[n]$ .

## Solution

$$\begin{aligned} X(z) &= \sum_{n=-\infty}^{+\infty} x[n]z^{-n} \\ &= \sum_{n=-\infty}^{+\infty} a^n z^{-n} u[n] \\ X(z) &= \frac{1}{1 - az^{-1}}, \quad |az^{-1}| < 1 \end{aligned}$$

$$a^n u[n] \xleftrightarrow{\mathcal{Z}} \frac{1}{1 - az^{-1}}, \quad |z| > |a|$$

## Example

Find the ZT of

$$x[n] = -a^n u[-n - 1].$$

## Example

Find the ZT of

$$x[n] = -a^n u[-n - 1].$$

## Solution

$$\begin{aligned} X(z) &= \sum_{n=-\infty}^{+\infty} x[n]z^{-n} \\ &= - \sum_{n=-\infty}^{+\infty} a^n z^{-n} u[-n - 1] \\ X(z) &= \frac{1}{1 - az^{-1}}, \quad |az^{-1}| > 1 \end{aligned}$$

## Example

Find the ZT of

$$x[n] = -a^n u[-n - 1].$$

## Solution

$$\begin{aligned} X(z) &= \sum_{n=-\infty}^{+\infty} x[n]z^{-n} \\ &= - \sum_{n=-\infty}^{+\infty} a^n z^{-n} u[-n - 1] \\ X(s) &= \frac{1}{1 - az^{-1}}, \quad |az^{-1}| > 1 \end{aligned}$$

$$-a^n u[-n - 1] \xleftrightarrow{\mathcal{Z}} \frac{1}{1 - az^{-1}}, \quad |z| < |a|$$

## $z$ -Plane and the Unit Circle

## $z$ -Plane and the Unit Circle

## $z$ -Plane and the Unit Circle

## Pole-Zero Plot for a Right-Handed Sequence

$$a^n u[n] \xleftrightarrow{\mathcal{Z}} \frac{1}{1 - az^{-1}} = \frac{z}{z - a}, \quad |z| > |a|$$

## Pole-Zero Plot for a Left-Handed Sequence

$$-a^n u[-n-1] \xleftrightarrow{\mathcal{Z}} \frac{1}{1 - az^{-1}} = \frac{z}{z - a}, \quad |z| < |a|$$

# First-Order Difference Equation

$$y[n] - ay[n - 1] = x[n]$$

# First-Order Difference Equation

$$y[n] - ay[n - 1] = x[n]$$

$$Y(z) - az^{-1}Y(z) = X(z)$$

# First-Order Difference Equation

$$y[n] - ay[n - 1] = x[n]$$

$$Y(z) - az^{-1}Y(z) = X(z)$$

$$Y(z) = \frac{1}{1 - az^{-1}}X(z)$$

# First-Order Difference Equation

$$y[n] - ay[n-1] = x[n]$$

$$Y(z) - az^{-1}Y(z) = X(z)$$

$$Y(z) = \frac{1}{1 - az^{-1}}X(z)$$

$$H(z) = \frac{1}{1 - az^{-1}}$$

Causality:

# First-Order Difference Equation

$$y[n] - ay[n - 1] = x[n]$$

$$Y(z) - az^{-1}Y(z) = X(z)$$

$$Y(z) = \frac{1}{1 - az^{-1}}X(z)$$

$$H(z) = \frac{1}{1 - az^{-1}}$$

Causality:  $|z| > |a|$

# First-Order Difference Equation

$$y[n] - ay[n-1] = x[n]$$

$$Y(z) - az^{-1}Y(z) = X(z)$$

$$Y(z) = \frac{1}{1 - az^{-1}}X(z)$$

$$H(z) = \frac{1}{1 - az^{-1}}$$

Causality:  $|z| > |a|$

$$h[n] = a^n u[n]$$

# Pole-Zero Plot for a DT First-Order System

This illustrates the determination of the Fourier transform from the pole-zero plot.

$$H(z) = \frac{z}{z - a}, \quad |z| > |a|.$$

## Second-Order Difference Equation

$$y[n] + 2r \cos \theta y[n - 1] + r^2 y[n - 2] = x[n]$$

## Second-Order Difference Equation

$$y[n] + 2r \cos \theta y[n-1] + r^2 y[n-2] = x[n]$$

$$Y(z) [1 + 2r \cos \theta z^{-1} + r^2 z^{-2}] = X(z)$$

## Second-Order Difference Equation

$$y[n] + 2r \cos \theta y[n-1] + r^2 y[n-2] = x[n]$$

$$Y(z) [1 + 2r \cos \theta z^{-1} + r^2 z^{-2}] = X(z)$$

$$Y(z) = \frac{1}{1 + 2r \cos \theta z^{-1} + r^2 z^{-2}} X(z)$$

## Second-Order Difference Equation

$$y[n] + 2r \cos \theta y[n-1] + r^2 y[n-2] = x[n]$$

$$Y(z) [1 + 2r \cos \theta z^{-1} + r^2 z^{-2}] = X(z)$$

$$Y(z) = \frac{1}{1 + 2r \cos \theta z^{-1} + r^2 z^{-2}} X(z)$$

$$H(z) = \frac{1}{1 + 2r \cos \theta z^{-1} + r^2 z^{-2}}$$

$\cos \theta < 1 \Rightarrow$  complex poles

Poles are at

## Second-Order Difference Equation

$$y[n] + 2r \cos \theta y[n-1] + r^2 y[n-2] = x[n]$$

$$Y(z) [1 + 2r \cos \theta z^{-1} + r^2 z^{-2}] = X(z)$$

$$Y(z) = \frac{1}{1 + 2r \cos \theta z^{-1} + r^2 z^{-2}} X(z)$$

$$H(z) = \frac{1}{1 + 2r \cos \theta z^{-1} + r^2 z^{-2}}$$

$\cos \theta < 1 \Rightarrow$  complex poles

Poles are at

$$re^{\pm j\theta}$$

# Pole-Zero Plot for a DT Under-Damped Second-Order System

This illustrates the determination of the Fourier transform from the pole-zero plot.

$$H(z) = \frac{1}{1 - (2r \cos \theta)z^{-1} + r^2 z^{-2}}, \quad |z| > |a|.$$

# Properties of the ROC of the $z$ -Transform

- The ROC does not contain poles
- The ROC of  $X(z)$  consists of a ring in the  $z$ -plane centered about the origin
- $\mathcal{F}\{x[n]\}$  converges  $\Leftrightarrow$  ROC includes the unit circle in the  $z$ -plane
- $x[n]$  finite duration  $\Rightarrow$  ROC is entire  $z$ -plane with the possible exception of  $z = 0$  or  $z = \infty$

## Properties of the ROC for a Right-Sided Sequence

- $x[n]$  right-sided and  $|z| = r_0$  is in ROC  $\Rightarrow$  all finite values of  $z$  for which  $|z| > r_0$  are in ROC.
- $x[n]$  right-sided and  $X(z)$  rational  $\Rightarrow$  ROC is outside the outermost pole.

# Properties of the ROC for a Left-Sided and for a Two-Sided Sequence

- $x[n]$  left-sided and  $|z| = r_0$  is in ROC  $\Rightarrow$  all values of  $z$  for which  $0 < |z| < r_0$  will also be in ROC.
- $x[n]$  left-sided and  $X(z)$  rational  $\Rightarrow$  ROC is inside the innermost pole.
- $x[n]$  two-sided and  $|z| = r_0$  is in ROC  $\Rightarrow$  ROC is a ring in the  $z$ -plane which includes the circle  $|z| = r_0$ .

## Example

Show the choices of the ROC for

$$X(z) = \frac{z}{\left(z - \frac{1}{3}\right)(z - 2)}.$$

## ROC If the Sequence Is Right-Sided.

$$X(z) = \frac{z}{\left(z - \frac{1}{3}\right)(z - 2)}.$$

## ROC If the Sequence Is Left-Sided.

$$X(z) = \frac{z}{\left(z - \frac{1}{3}\right)(z - 2)}.$$

## ROC If the Sequence Is Two-Sided.

$$X(z) = \frac{z}{\left(z - \frac{1}{3}\right)(z - 2)}.$$

# Inverse $z$ -Transform

$$X(z) = \mathcal{F} \{x[n]r^{-n}\}$$

$$x[n]r^{-n} = \mathcal{F}^{-1} \{X(z)\}$$

$$= \frac{1}{2\pi} \int_{2\pi} X(re^{j\omega}) e^{-j\omega n} d\omega$$

$$x[n] = \frac{1}{2\pi} \int_{2\pi} X(re^{j\omega}) (re^{j\omega})^n d\omega$$

$$z = re^{j\omega}, \quad dz = jre^{j\omega} d\omega$$

$$x[n] = \frac{1}{2\pi j} \oint X(z) z^{n-1} dz$$

## Example

$$X(z) = \frac{z}{\left(z - \frac{1}{3}\right)(z - 2)}, \quad |z| > 2.$$

## Example

$$X(z) = \frac{z}{\left(z - \frac{1}{3}\right)(z - 2)}, \quad |z| > 2.$$

$$\begin{aligned} X(z) &= \frac{z}{\left(z - \frac{1}{3}\right)(z - 2)}, \quad |z| > 2, \\ &= \frac{z^{-1}}{\left(1 - \frac{1}{3}z^{-1}\right)(1 - 2z^{-1})}, \quad |z| > 2, \\ &= \frac{-\frac{3}{5}}{\left(1 - \frac{1}{3}z^{-1}\right)} + \frac{-\frac{3}{5}}{(1 - 2z^{-1})}, \quad |z| > 2. \end{aligned}$$

$$x[n] = -\frac{3}{5} \left(\frac{1}{3}\right)^n u[n] + \frac{3}{5} (2)^n u[n].$$

## Example

$$X(z) = \frac{z}{\left(z - \frac{1}{3}\right)(z - 2)}, \quad |z| > 2.$$

$$\begin{aligned} X(z) &= \frac{z}{\left(z - \frac{1}{3}\right)(z - 2)}, \quad |z| > 2, \\ &= \frac{z^{-1}}{\left(1 - \frac{1}{3}z^{-1}\right)(1 - 2z^{-1})}, \quad |z| > 2, \\ &= \frac{-\frac{3}{5}}{\left(1 - \frac{1}{3}z^{-1}\right)} + \frac{-\frac{3}{5}}{(1 - 2z^{-1})}, \quad |z| > 2. \end{aligned}$$

$$x[n] = -\frac{3}{5} \left(\frac{1}{3}\right)^n u[n] + \frac{3}{5} (2)^n u[n].$$

# Outline

## $z$ -Transform

The  $z$ -Transform

$z$ -Transform properties

## Recall: $z$ -Transform

$$X(z) = \sum_{n=-\infty}^{+\infty} x[n]z^{-n}$$

$$x[n] = \frac{1}{2\pi j} \oint X(z)z^{-n}dz$$

$$X(z)|_{z=e^{j\omega}} = \mathcal{F}\{x[n]\}$$

$$z = re^{j\omega}$$

$$X(z) = \mathcal{F}\{x[n]r^{-n}\}$$

# z-Transform Properties

Property	Signal	Transform	ROC
Linearity	$ax_1[n] + bx_2[n]$	$aX_1(z) + bX_2(z)$	at least $R_1 \cap R_2$
Time shifting	$x[n - n_0]$	$z^{-n_0} X(z)$	$R$
Scaling in $z$ domain	$z_0^n x[n]$	$X\left(\frac{z}{z_0}\right)$	$ z_0 R$
	$e^{j\omega n} x[n]$	$X(e^{-j\omega n} z)$	$R$
	$a^n x[n]$	$X(a^{-1} z)$	Scaled version of $R$ (i.e., $ a R$ , the set of points $\{a z \}$ for $z$ in $R$ )
Time reversal	$x[-n]$	$X(z^{-1})$	Inverted $R$ (i.e., $R^{-1}$ = the set of points $z^{-1}$ , where $z$ is in $R$ ).
Time expansion	$x_{(k)}[n] = \begin{cases} x[r], & n = rk \\ 0, & n \neq rk \end{cases}$ for some integer $r$ .	$X(z^k)$	$R^{1/k}$ (i.e., the set of points $z^{1/k}$ , where $z$ is in $R$ )
Convolution	$x_1[n] * x_2[n]$	$X_1(z)X_2(z)$	at least $R_1 \cap R_2$

## z-Transform Properties II

Property	Signal	Transform	ROC
Conjugation	$x^*[n]$	$X^*(z^*)$	$R$
Convolution	$x_1[n] * x_2[n]$	$X_1(z)X_2(z)$	At least the intersection of $R_1$ and $R_2$
First difference	$x[n] - x[n-1]$	$(1 - z^{-1})X(z)$	At least the intersection of $R$ and $ z  > 0$
Accumulation	$\sum_{k=-\infty}^n x[k]$	$\frac{1}{1 - z^{-1}}X(z)$	At least the intersection of $R$ and $ z  > 1$
Differentiation in the $z$ -domain	$nx[n]$	$-z \frac{dX(z)}{dz}$	$R$

Initial value theorem:

If  $x[n] = 0$  for  $n < 0$ , then  $x[0] = \lim_{z \rightarrow \infty} X(z)$

## Example

Consider an LTI system for which

$$y[n] = h[n] * x[n],$$

where

$$h[n] = \delta[n] - \delta[n - 1].$$

1. Find  $H(z)$ .
2. Find  $y[n]$  in terms of  $x[n]$ .

Note that

$$\delta[n] - \delta[n - 1] \xleftrightarrow{\mathcal{Z}} 1 - z^{-1},$$

with ROC equal to the entire  $z$ -plane, except the origin. Also, this  $z$ -transform has a zero at  $z = 1$ . If

$$x[n] \xleftrightarrow{\mathcal{Z}} X(z), \quad \text{with ROC} = R. \quad (1)$$

then

$$y[n] \xleftrightarrow{\mathcal{Z}} (1 - z^{-1})X(z), \quad (2)$$

with ROC equal to  $R$  with the possible deletion of  $z = 0$  and or addition of  $z = 1$ .  
Note for this system

$$y[n] = [\delta[n] - \delta[n - 1]] * x[n] = x[n] - x[n - 1]. \quad (3)$$

# System Stability

$$Y[n] = h[n] * x[n]$$

$$Y(z) = H(z)X(z)$$

# System Stability

$$Y[n] = h[n] * x[n]$$

$$Y(z) = H(z)X(z)$$

$$\text{stable} \Leftrightarrow \sum_{-\infty}^{\infty} |h[n]| < \infty$$

$$\mathcal{F}\{h[n]\} \Leftrightarrow \sum_{-\infty}^{\infty} |h[n]| < \infty$$

# System Stability

$$Y[n] = h[n] * x[n]$$

$$Y(z) = H(z)X(z)$$

$$\text{stable} \Leftrightarrow \sum_{-\infty}^{\infty} |h[n]| < \infty$$

$$\mathcal{F}\{h[n]\} \Leftrightarrow \sum_{-\infty}^{\infty} |h[n]| < \infty$$

The condition for stability and the existence of the Fourier transform are the same.

# Stability, Causality, and ROC

stable  $\Leftrightarrow$  ROC of  $H(z)$  includes unit circle in  $z$ -plane

causal  $\Rightarrow h[n]$  is right-sided

$\Rightarrow$  ROC of  $H(z)$  outside the outermost pole

causal and stable  $\Leftrightarrow$  All poles inside unit circle

## Example

Discuss the stability and causality of the system represented by the following system function with respect to different regions of convergence.

$$H(z) = \frac{z}{\left(z - \frac{1}{3}\right)(z - 2)}.$$

The system is causal and unstable.

The system is unstable and not causal.

The system is stable and not causal.

## Example

Consider the LTI system for which the input  $x[n]$  and the output  $y[n]$  satisfy the linear constant-coefficient difference equation

$$y[n] - \frac{1}{2}y[n-1] = x[n] + \frac{1}{3}x[n-1].$$

1. Obtain an expression for the system function  $H(z)$ .
2. What are the two choices for the region of convergence?
3. Obtain  $h[n]$  for each of these cases and comment on the stability and causality.

$$Y(z) - \frac{1}{2}z^{-1}Y(z) = X(z) + \frac{1}{3}z^{-1}X(z)$$

$$Y(z) - \frac{1}{2}z^{-1}Y(z) = X(z) + \frac{1}{3}z^{-1}X(z)$$

$$Y(z) = X(z) \left[ \frac{1 + \frac{1}{3}z^{-1}}{1 - \frac{1}{2}z^{-1}} \right]$$

$$Y(z) - \frac{1}{2}z^{-1}Y(z) = X(z) + \frac{1}{3}z^{-1}X(z)$$

$$Y(z) = X(z) \left[ \frac{1 + \frac{1}{3}z^{-1}}{1 - \frac{1}{2}z^{-1}} \right]$$

$$H(z) = \frac{Y(z)}{X(z)} = \frac{1 + \frac{1}{3}z^{-1}}{1 - \frac{1}{2}z^{-1}}$$

There are two choices for the RoC:

$|z| > 1/2$ : with the assumption that  $h[n]$  is right sided.

$|z| < 1/2$ : with the assumption that  $h[n]$  is left sided.

If  $|z| > 1/2$ : with the assumption that  $h[n]$  is right sided.

$$H(z) = \left(1 + \frac{1}{3}z^{-1}\right) \frac{1}{1 - \frac{1}{2}z^{-1}}$$

If  $|z| > 1/2$ : with the assumption that  $h[n]$  is right sided.

$$H(z) = \left(1 + \frac{1}{3}z^{-1}\right) \frac{1}{1 - \frac{1}{2}z^{-1}}$$

$$h[n] = \left(\frac{1}{2}\right)^n u[n] + \frac{1}{3} \left(\frac{1}{2}\right)^{n-1} u[n-1]$$

If  $|z| > 1/2$ : with the assumption that  $h[n]$  is right sided.

$$H(z) = \left(1 + \frac{1}{3}z^{-1}\right) \frac{1}{1 - \frac{1}{2}z^{-1}}$$

$$h[n] = \left(\frac{1}{2}\right)^n u[n] + \frac{1}{3} \left(\frac{1}{2}\right)^{n-1} u[n-1]$$

$|z| < 1/2$ : with the assumption that  $h[n]$  is left sided.

$$h[n] = -\left(\frac{1}{2}\right)^n u[-n-1] - \frac{1}{3} \left(\frac{1}{2}\right)^{n-1} u[-n]$$

In this case the system is anticausal ( $h[n] = 0$  for  $n > 0$ ) and unstable.
